True Story 3

SUCCESS in TEST AUTOMATION

YES! Vannon
kautta kiven ja
kannon...

Scene 1: Deciding test tool strategy

These are the test cases we have to run over and over again. I think we could use a test automation tool here to help us.

Selecting a proper tool is not easy. We have to make evaluation with 2-3 tools. And we have to try do something that is not too simple.

That would mean 30-50% of test cases to be automated. As a start it is a reasonable target.

Scene 2: Tool evaluation

This WonderTest works fine with our evaluation tests. But to get it working with the Swedish version I have to edit the scripts a lot !

I tried it with SuperTest. I only have to make a table of the texts in different languages and the tool does the script mapping fine!

Lucky you! With QualityForce I have to code all the scripts before I can try even the first one of them...

Scene 3: Selecting the tool

Its price is on medium level and basic user training is included. Let's make a proper deployment plan!

There's a good capture-replay, and editing the scripts is easy.
Also the user guide is easy to use

Based on these evaluation reports, SuperTest seems to be the best for our purposes.

Scene 4: Using the tool

Hello! I'm investigating a tricky error situation that occurs if there is high load on this system. Can you help in producing the load?

SuperTest saves my day!
In the old days, to get the same high load I would have had to ask the whole team to stay overtime...

Sure, I can.
I will just take the SuperTest scripts from the library and put them running. You can start your debugging after 15 minutes.

...and they lived happily ever after using
SuperTest
for next four years ...

The only reason for changing the tool then was that their development environment changed and SuperTest did not have integration to the new environment.
